

SmartMsg Client

- Initiate alerts/notifications to individuals and groups across a full range of communication devices
- Full communications interoperability from a single point of entry
- Supports voice, text and video conferencing sessions on any two-way communications device
- Security settings to monitor user/group messaging privileges

The SmartMsg Client desktop application enables users to initiate SmartMsg alert notifications to individuals and groups across a wide variety of communications devices— everything from two-way radios, landlines, cell phones and smartphones, to PCs, TDD/TTY devices and text pagers.

Enables IP-based users to conduct voice, text and video conferencing sessions with other users on any two-way device, as well as share files, and collaborate via whiteboarding.

SmartMsg Client provides a single point of entry for comprehensive interoperable communications to support emergency preparedness and response, command and control, and incident response, while supporting operational continuity across any jurisdiction, agency or enterprise.

The interface enables users to view message logs, initiate chat sessions, and establish send/receive messaging privileges for specific users and groups.
